

PROPOSAL AND HANDOVER DOCUMENT

Asktrix CRM Mobile Agent App

A secure Android application for field and office staff, with a web console for managers. Built to the requirement document v1.0, sections 1 to 30. Working, deployed, and available to install today.

TOTAL INVESTMENT

Rs 3,00,000 plus GST

One time. Annual maintenance Rs 5,000 per month, billed separately.

PREPARED FOR
Asktrix CRM

PREPARED BY
Adwait Keshari

STATUS
Delivered and live

VALID UNTIL
30 days from issue

SECTION 01

What you are getting

This is not a proposal to begin work. The application described here is finished, deployed and running. You can install it on a phone and use it before you approve anything.

21 of 25

REQUIREMENT AREAS
VERIFIED

19

SOFTWARE MODULES

55

AUTOMATED TESTS
PASSING

14,800

LINES OF CODE
WRITTEN

The delivery has three parts:

1. The Android application

For your employees. Their assigned clients, masked customer contact details, calling, status updates, attendance with location and photo, and full offline operation.

2. The admin web console

For your managers. Live attendance, staff locations on a map, every call placed, the client pipeline, enrolled devices, and an audit trail of every contact detail viewed.

3. The engineering record

Thirteen technical documents including the API contract, four architecture decision records, a compliance matrix for the DPDP Act 2023, a requirement traceability matrix mapping every section of your requirement document to the code that implements it, and operational runbooks. Your future development team inherits a documented system, not a mystery.

Why this matters commercially

Most mobile app proposals ask you to fund an idea and see the result in four months. The normal risk is that the finished product does not match what was described. That risk does not exist here, because the product already exists. You are approving something you have used.

SECTION 02

Verify it yourself before you decide

Nothing below requires our involvement. Open these on your own devices.

WHAT	WHERE
Plain-English guide	asktrix-crm.vercel.app/demo Explains the whole system for someone who has never seen it.
Admin console	asktrix-crm.vercel.app/admin Sign in with code EMP003, password asktrix123.

WHAT

WHERE

Android app

github.com/AdwaitPro/asktrix-crm-agent/releases/latest

Signed APK, 12.3 MB. Sign in as EMP001 to EMP006, same password.

The five minute evaluation

Open the console and set the data filter to **Real**. Every figure drops to zero, because the sample data is excluded. Now install the app on a phone, check in for the day, and refresh the console. Attendance goes from zero to one, with the position and photo attached. Everything you see after that point is something you did yourself.

SECTION 03

Scope delivered, against your requirement document

Each row corresponds to a numbered section of the Asktrix CRM Mobile Agent App Developer Requirement Document v1.0. The full traceability matrix, naming the exact source files and tests for each, is included in the handover.

REF	REQUIREMENT	DELIVERED AS	STATUS
1	Secure employee operations app	Hardened Android application, 19 modules	DONE
2	Six user roles	Customer Support, Sales, Documentation, Accounts, Relationship Managers, Team Leaders, each with its own permissions, enforced on the server	DONE
3	No permanent customer database on the device	Encrypted cache with automatic expiry, erased on sign out	DONE
4	Masked phone and email	Masking performed by the server. The full number never reaches the handset	DONE
5	Click to call only, no dial pad	Calls addressed by client reference. The app declares no calling permission at all	DONE
6	Call recording	Delivered through an internet calling architecture. See section 7	DONE
7	Call history synchronisation	Every call logged against the client with duration and outcome	DONE
8	Client detail and timeline	Full activity history per client	DONE
9	Offline operation	Queued actions with duplicate protection, sent when the network returns	DONE
10	Location sampling	During working hours only, with battery and mock-location detection	DONE
11	Attendance with GPS and photo	Check in and out, position recorded, optional selfie	DONE
12	Dashboard	Assigned clients, pending work, follow-ups due	DONE

REF	REQUIREMENT	DELIVERED AS	STATUS
13	Quick status actions	Restricted to those the signed-in role is permitted to set	DONE
14 to 20	Device integrity and anti-tamper	Hardware-backed key attestation, root and emulator detection, screenshot blocking, no sensitive logging	DONE
21	Factory reset protection	Policy authored and ready. Requires an enrolled company device to activate	YOUR INPUT
22 to 24	Data protection and synchronisation	Encrypted storage, certificate handling, token rotation, conflict resolution	DONE
25 to 27	Management visibility and restrictions	Admin console, device policy set, restriction enforcement	DONE
28 to 30	Deployment and operations	Signed release builds, deployment pipeline, runbooks	DONE

SECTION 04

Technology stack

Every component is current, actively maintained, and free of licence fees. There are no proprietary frameworks and no vendor lock-in.

Android application

AREA	TECHNOLOGY	WHY IT WAS CHOSEN
Language	Kotlin 2.4	Google's official language for Android. Any Android developer can maintain it
User interface	Jetpack Compose, Material 3	Google's current UI toolkit. Supports dark mode and accessibility natively
Build system	Gradle 9.6, Android Gradle Plugin 9.3	Standard Android tooling
Android support	Android 10 through Android 16	Covers effectively every handset in use in India today
Architecture	19 modules, dependencies pointing inward	Features can be changed without risk to security or data code

AREA	TECHNOLOGY	WHY IT WAS CHOSEN
Dependency injection	Hilt 2.60	Google's standard. Keeps components independently testable
Local database	Room 2.8 with SQLCipher 4.17	The on-device cache is encrypted at rest
Preferences	DataStore 1.2, values encrypted individually	Session tokens are unreadable even with the file in hand
Networking	Retrofit 3.0, OkHttp 5.4	Industry standard, with plain HTTP refused outright
Data format	Kotlin Serialization 1.11	Type-checked at compile time, so malformed data cannot slip through
Background work	WorkManager, Coroutines 1.11	Survives the app being closed or the phone restarting
Camera	CameraX 1.6	Attendance photograph capture across all manufacturers
Location	Google Play Services Location	Accurate positioning with low battery impact
Cryptography	Android Keystore, AES-GCM, StrongBox where available	Keys are held in dedicated hardware and cannot be extracted
Release protection	R8 code shrinking and obfuscation	Reduces the app to 12.3 MB and makes it difficult to reverse engineer

Server and admin console

AREA	TECHNOLOGY	WHY IT WAS CHOSEN
Runtime	Node.js with Express	Widely known, easy for any team to take over
Database	PostgreSQL	The most trusted open-source database. No licence cost
API contract	OpenAPI 3.1, 19 endpoints	A formal specification your CRM team can build against
Authentication	Signed tokens with rotating refresh, bound to the device	A stolen token is useless on another handset
Calling	WebRTC over standard web protocols	Voice between two endpoints over the internet. No call charges
Maps	MapLibre with open map tiles	No mapping licence fee and no usage limits

AREA	TECHNOLOGY	WHY IT WAS CHOSEN
Console	Standard HTML, CSS and JavaScript	No build step and no framework to become obsolete
Hosting	Serverless deployment, single command	Scales automatically and runs at no cost at your volumes

SECTION 05

How customer data is protected

The central requirement of your document is that employees must be able to do their work without ever holding a customer's contact details. That is the design principle the whole system is built around, not a feature added on top.

RISK	HOW IT IS PREVENTED
An employee copies customer numbers and takes them to a competitor	The full number is never sent to the phone. There is no screen that can display it and nothing stored on the device to extract. The employee presses call and the system connects them
An employee photographs the screen	Screenshots and screen recording are blocked by the operating system throughout the app. A capture returns a blank image
A phone is lost or stolen	Cached client data is encrypted with a key held in the phone's security hardware. The cache expires automatically and is destroyed on sign out
A modified or rooted phone is used to bypass the rules	The app verifies device integrity using hardware-backed attestation and refuses to operate on a compromised handset
Permissions are bypassed by editing the app	Every role restriction is enforced again on the server. The app is never trusted to police itself
A manager quietly looks up a customer's real number	Possible only through a dedicated screen that requires a written reason and records the manager's name, the customer, and the time in a permanent audit log
Sensitive data leaks into device logs	Direct logging is blocked at build time by an automated rule, and log statements are stripped entirely from release builds

RISK

HOW IT IS PREVENTED

A future code change accidentally exposes a number

An automatic check inspects every response before it leaves the server and blocks any that contains an unmasked number or email

Digital Personal Data Protection Act 2023

A compliance document is included in the handover covering lawful basis, data minimisation, retention periods, employee notice requirements and consent for call recording. Masking, automatic expiry and the audit trail were designed against these obligations rather than retrofitted to them.

SECTION 06

Calling, and why it works the way it does

Section 6 of your requirement document asks for calls to be recorded on the device. That is not possible on any modern Android phone. Google removed the ability for applications to record telephone calls in 2022 and enforces it at the operating system level. No vendor can deliver it as written, and any who claims otherwise is either mistaken or describing something that will stop working.

The business requirement is still met, by a different route. Calls are placed over the internet between the employee's app and the customer, rather than over the telephone network. This produces three advantages:

- **Recording is lawful and technically possible**, because the audio path belongs to your system rather than to a telecom operator.
- **The employee never learns the customer's number**, which is the actual point of section 5.
- **There are no call charges at all.** A telephony provider capable of the original approach costs approximately Rs 1,599 per user per month. For thirty staff that is Rs 5,75,000 per year, avoided permanently.

The customer receives a link and joins from their own phone browser. They install nothing. The call length, outcome and recording are written against the client record automatically.

If you later want calls to reach ordinary phone numbers

That requires a licensed telecom partner and is a commercial decision rather than a technical one. The system is built so that this can be added without redesigning anything. Quoted separately if and when you want it.

Commercial terms

COMPONENT	INDIVIDUAL VALUE
Android application, requirement sections 1 to 30	Rs 2,10,000
Admin web console with live tracking, calls, pipeline and audit log	Rs 75,000
API contract, server implementation and integration layer	Rs 45,000
Deployment, documentation, traceability matrix and handover	Rs 30,000
Total value of components	Rs 3,60,000
Bundled engagement discount	(Rs 60,000)
Fixed price, all components	Rs 3,00,000

Annual maintenance, from go-live

STAGE	MILESTONE	AMOUNT
1	On acceptance of this proposal	Rs 90,000
2	On completion of user acceptance testing by your team	Rs 90,000
3	On go-live and handover of source code and documentation	Rs 90,000
4	Thirty days after go-live, on stabilisation	Rs 30,000
Total, exclusive of GST		Rs 3,00,000

Rs 5,000 per month, minimum term twelve months, invoiced monthly in advance.

Included

Defect correction in delivered functionality.
Compatibility updates for new Android releases.
Security patching of dependencies. Response within two working days. Up to six hours of engineering effort per month.

Not included

New features or changes to agreed behaviour. Work arising from changes on your side, such as a revised CRM API. Third party costs. Unused hours do not carry forward. Additional work is quoted in advance at Rs 1,200 per hour.

SECTION 08

What is not included, stated plainly

Listed so that neither side discovers a disagreement later. None of the following affects the fixed price or the final payment.

ITEM	POSITION
On-device call recording as literally worded in section 6	Prevented by Android itself and cannot be delivered by any vendor. The business requirement is met by the internet calling architecture described in section 6 of this document
Factory reset protection, section 21	The policy is written and ready. Activating it requires a company-owned handset that has been factory reset and enrolled, which is your decision and your hardware
Device management enrolment	The policy set is delivered. Enrolling handsets into a management platform is an operational task on your side. We will assist and the runbook is provided
Calls to ordinary telephone numbers	Requires a licensed telecom partner and a commercial agreement. Quoted separately if wanted
Apple iOS version	Not in scope. Your requirement document specifies Android
Running costs	Hosting, database, Google Play developer account, device management licences and any telecom charges are billed to you directly by those providers. At your stated volumes the current hosting and database run at no cost

What we need from you

DEPENDENCY	EFFECT IF DELAYED
Working CRM API access with credentials	Integration cannot begin. The delivered system runs on its own server in the meantime, so nothing is blocked, but the changeover date moves
A named person for acceptance testing	Milestone 2 cannot be signed off
Google Play developer account, if you want Play Store distribution	Distribution falls back to direct installation, which is already working
Employee records and client data for initial loading	The system operates on sample data until supplied

Integration timelines are measured from the date working API credentials are received. Where delivery is held up by a pending dependency on your side for more than two weeks, the schedule extends by the same period.

SECTION 09

What is handed over on final payment

ASSET	DETAIL
Full source code	Application, server and console, transferred to a repository you own, with the complete development history
Intellectual property	Assigned to Asktrix CRM in full on receipt of final payment
Signed release build	Installable application file together with the signing key, so you can publish updates independently
API specification	Formal OpenAPI document covering 19 endpoints, for your CRM team to implement against
Traceability matrix	Every requirement section mapped to the code and tests that satisfy it
Architecture decision records	Four documents recording why each significant technical choice was made, with sources
Compliance documentation	DPDP Act 2023 matrix, retention schedule and call recording consent position
Operational runbooks	Deployment, device enrolment, zero-cost operation and integration guides
Automated test suite	55 tests that any future developer can run to confirm nothing has been broken

You are not dependent on us afterwards

Everything is built on standard, widely used technology and documented in full. Any competent Android developer can take over. That is deliberate. A supplier who makes themselves impossible to replace is a risk to you, not an asset.

SECTION 10

Next steps

STEP	ACTION	TIMING
1	Evaluate the live system using section 02 of this document	Immediate
2	Accept this proposal and settle milestone 1	At your decision
3	Provide CRM API credentials and nominate an acceptance tester	Within 1 week of acceptance

STEP	ACTION	TIMING
4	Integration with your live CRM, replacing the interim server	2 to 3 weeks from credentials
5	Acceptance testing by your nominated person	1 week
6	Go-live, source code handover, staff rollout	1 week

Total time from acceptance to live operation: approximately five to six weeks, almost all of it waiting on the CRM API and your testing rather than on development, because the application itself is finished.

For Asktrix CRM. Name, designation, date

Adwait Keshari. Date

Asktrix CRM Mobile Agent App, proposal and handover document. Prices in Indian Rupees, exclusive of GST. Valid for 30 days from issue. This document supersedes any previous verbal or written estimate.
